Europa Spam Filter Deployment Configuration

The standard deployment configuration consists of a single email server and a single Europa Appliance. Simply connect the Europa Appliance to your network by assigning it a new IP address and changing your MX record to point to the Europa Appliance.

Europa Spam Filter and Email Server Deployment Configuration

The standard deployment configuration consists of a single Europa Appliance with the Email Service turned on. Simply connect the Europa Appliance to your network by assigning it a new IP address and changing your MX record to point to the Europa Appliance.

Europa Spam Filter and Hot Standby Redundant Email Server Deployment Configuration

The Hot Standby Redundant Email Server deployment configuration consists of a single Europa Appliance similar to the first configuration. With Hot Standby Redundancy, emails are delivered to your email server and kept on Europa. **When the Email Server is down, Europa will queue emails for delivery. Meanwhile, users may use Europa to read and write emails for continuity.** An alert message will be sent to a list of configured notify users. When the external Email server is back online, all the queued emails will be delivered to your email server.
